Praktikum 10

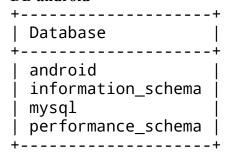

Android MySQL Create dan Multi Read

- 1. Sebelum memulai dengan proyek Android, nyalakan XAMPP yang terpasang di komputer masing-masing. Lalu cek apakah localhost bisa diakses atau tidak.
- 2. Jika berhasil mengakses, gunakan PHPMyAdmin untuk membuat database "android" dan tabel "databarang" baru.
- 3. Kolom-kolom di tabel "users":

+	Туре	•	Key	Default	•
id kodebarang namabarang kuantitas	int(11) varchar(100) varchar(100) int(11)	NO NO NO NO	PRI UNI		auto_increment

4. Hasil dari Database dan Tabel:

DB android

Tabel databarang

+	-+
Tables_in_android	•
users	-+
+	-+

5. Isilah dengan data Dummy untuk menguji Aplikasi Android nanti, contoh:

id	nama	+ username +	password	
1	Maulana	maulana 	maulana	

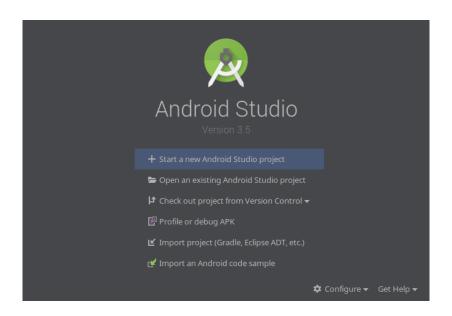

6. Berikutnya adalah membuat file PHP di htdocs (Pastikan file bisa diakses nanti!)

```
connect.php
<?php
       $HOST = 'localhost';
       USER = 'root';
       PASS = 'root';
       $DB = 'android';
       $CON = mysqli connect($HOST,$USER,$PASS,$DB) or die(mysqli er-
ror($CON));
read.php
<?php
       require once('connect.php');
       id = GET['id'];
       // $id = '1'
       $result = array();
       $query = mysqli query($CON,"SELECT * FROM users WHERE id=".$id.";")
or die(mysqli error($CON));
       while($row = mysqli fetch assoc($query)){
               \left| \frac{1}{2} \right| = \left| \frac{1}{2} \right|
       echo json encode(array('result'=>$result));
?>
```

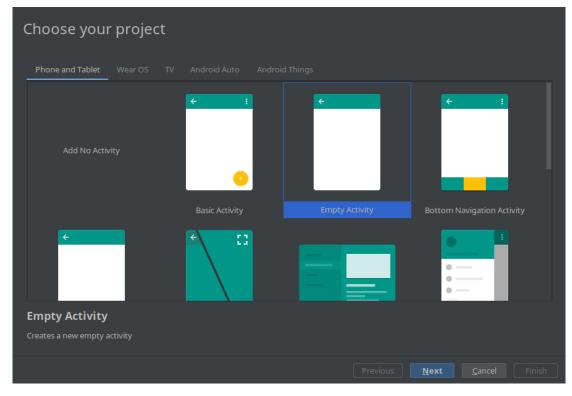

7. Tes koneksi ke PHP dengan menggunakan Web Browser, gunakan http://local-host/read.php?id=1 (tergantung dari letak file!!!). Jika benar akan muncul gambar berikut:

```
{"result":[{"id":"1","nama":"Maulana","username":"maulana","password":"
```

8. Lalu buatlah proyek baru dengan Android Studio

9. Pilih Empty Activity untuk memulai aplikasi baru

10. Bukalah file build.gradle (Module: app) lalu tambahkan tulisan tebal putih berikut:

```
dependencies {
    implementation fileTree(dir: 'libs', include: ['*.jar'])
    implementation"org.jetbrains.kotlin:kotlin-stdlib-jdk7:$kotlin_version"
    implementation 'androidx.appcompat:appcompat:1.0.2'
    implementation 'androidx.core:core-ktx:1.0.2'
```

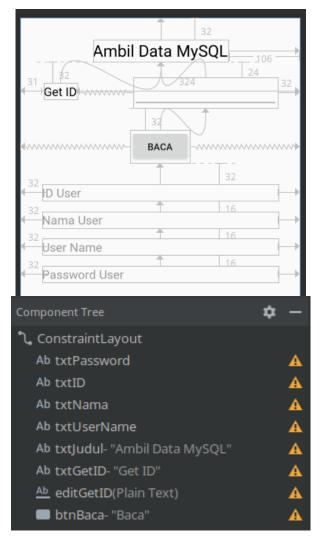

```
implementation 'androidx.constraintlayout:constraintlayout:1.1.3' testImplementation 'junit:junit:4.12' androidTestImplementation 'androidx.test:runner:1.1.1' androidTestImplementation 'androidx.test.espresso:espresso-core:3.1.1'
```

11. Sync Project, lalu tambahkan kode berikut ke AndroidManifest.xml

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.example.sqlquery">
```

12. Kemudian buatlah Layout sebagai berikut:

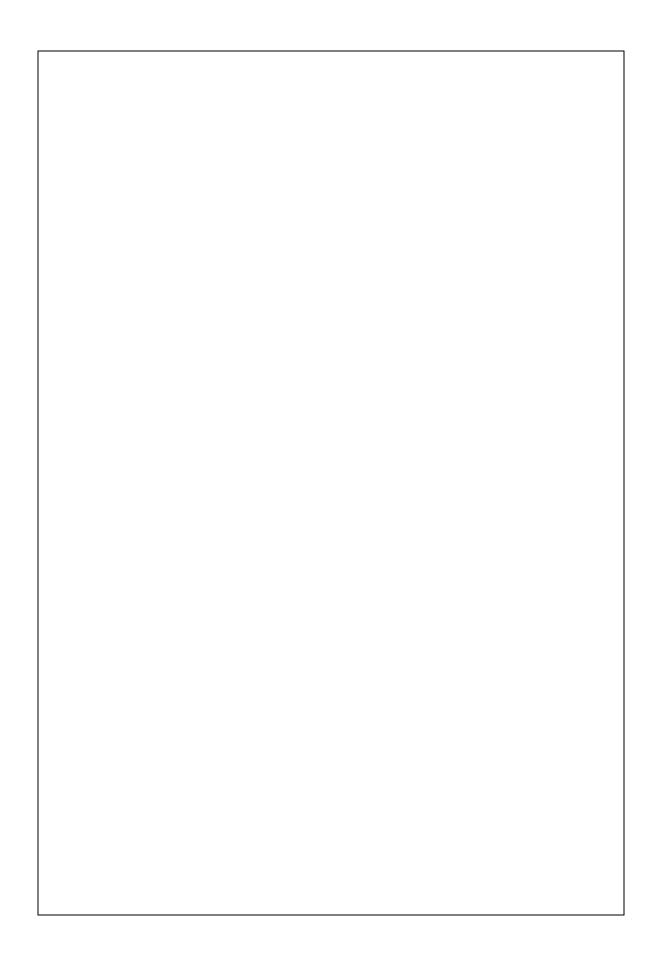

}

13. Kemudian edit MainActivity.kt

```
package com.example.sqlquery
import android.app.ProgressDialog
import androidx.appcompat.app.AppCompatActivity
import android.os.Bundle
import android.util.Log
import android.widget.Button
import android.widget.EditText
import android.widget.TextView
import android.widget.Toast
import com.androidnetworking.AndroidNetworking
import com.androidnetworking.common.Priority
import com.androidnetworking.error.ANError
import com.androidnetworking.interfaces.JSONObjectRequestListener
import org.json.JSONObject
import okhttp3.OkHttpClient
import androidx.core.app.ComponentActivity
import androidx.core.app.ComponentActivity.ExtraData
import androidx.core.content.ContextCompat.getSystemService
import android.icu.lang.UCharacter.GraphemeClusterBreak.T
class MainActivity : AppCompatActivity() {
  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)
    setContentView(R.layout.activity main)
```

192.168.xxx.xxx

```
}
}
```

14. Kompile Kode dan Jalankan
